**[Demir, H. & Seyyar, O. 2017. Annotated checklist of the spiders of Turkey. Munis Entomology & Zoology, 12 (2): 433-469]**

**ABSTRACT:** The list provides an annotated checklist of all the spiders from Turkey. A total of 1117 spider species and two subspecies belonging to 52 families have been reported. The list is dominated by members of the families Gnaphosidae (145 species), Salticidae (143 species) and Linyphiidae (128 species) respectively.

**KEY WORDS:** Araneae, Checklist, Turkey, Fauna

To date, Turkish researches have been published three checklist of spiders in the country. The first checklist was compiled by Karol (1967) and contains 302 spider species. The second checklist was prepared by Bayram (2002). He revised Karol's (1967) checklist and reported 520 species from Turkey. Latest checklist of Turkish spiders was published by Topçu et al. (2005) and contains 613 spider records.

A lot of work have been done in the last decade about Turkish spiders. So, the checklist of Turkish spiders need to be updated. We updated all checklist and prepare a new checklist using all published the available literatures. This list contains 1117 species of spider species and subspecies belonging to 52 families from Turkey (Table 1).

This checklist is compile from literature dealing with the Turkish spider fauna. The aim of this study is to determine an update list of spider in Turkey.

### ***The Annotated Checklist Format***

The checklist of the Turkish spider fauna is compiled using published records. Species referred to in postgraduate theses and scientific meetings are not formal publications and are consequently not considered herein. Only published papers are used. The general distribution of species was obtained from World Spider Catalog, 2016.

## **DISCUSSION**

With this annotated checklist, the species number of Turkish spider fauna increased 1117 species and subspecies in 339 genera species belonging to 52 families (Fig. 1). We summarized all published checklists dealing with the spider of Turkey in figure.

It is very difficult to estimate of the total spider diversity of Turkey. Its neighbouring countries has almost finished taxonomic studies dealing with their the spider fauna, the spider faunas of Bulgaria (1038), Greece (856) , Iran (528), Israel (631), Europe (4.800), Caucasia (1107) and Russia and adjacent countries (3.340) are known (blagoev, 2016; Bosmans, Chatzaki 2005; Mirhamsi et al. 2015; Heldsingen, 2011; Otto, 2015; Mikhalov, 2014). Although increasing studies on Turkish spider fauna, with this study is reached this number to 1117 (Fig. 2).

The zoogeographic classification of the Turkish spiders has been made on the basis of literature datas reflecting their current distribution (World Spider Catalog, 2016) (Fig. 3). According to their current distribution, the Turkish spiders are classified in fifteen zoogeographical categories (Cosmopolitan, Holarctic, Palearctic, Old World, Pantropica, European, Asian, Mediterranean, Afrotropico-Mediterranean, European-Mediterranean, Mediterranean-Asian, European-Asian, Middle East, Other, Turkey). The percentages of the spiders in this classification were found as follow: Cosmopolitan 2%, Holarctic 8%, Palearctic 23%, Old World 0.5%, Pantropica 0.2%, European 12%, Asian 5%, Mediterranean 13%, Afrotropico-Mediterranean 3%, European-Mediterranean 2%, Mediterranean-Asian 6%, European-Asian 10%, Middle East 0.5%, Other 2%, Turkey 14%.

Despite an increase in studies on Turkish spiders during recent years, there are still many regions of the country that remain insufficiently investigated. The real diversity of Turkish spider fauna is much higher, but it is still poorly known.
